

Abstract

In a shopping cart, which is nestable into a preceding, similarly constructed cart and into which a following, similarly constructed cart is nestable, a chassis has front and rear casters including two rear, transversely spaced casters and has
5 two generally longitudinal members, each extending along one side of the chassis, on which two camming elements are mounted. A transversely extending member is mounted to and bridges the longitudinal members. The transversely extending member is adapted to be upwardly cammed by the camming elements of a following, similarly constructed cart, which is being nested into the shopping cart,
10 so as to elevate the rear casters of the shopping cart.
